QA Player

Player	QA Player	**Report date**	27 Oct 2026, 11:15 PM IST
Analysis	Bowling	**Camera**	front-on
Video quality	Good	**Score status**	Provisional Technique Score

Three key takeaways

1. Balance in follow-through (0.09 × torso length) was your strongest measured area.
2. Release hand height (1.92 × torso length) is the measurement with the most room to improve.
3. Practise “Front-arm pull-down” — 3 sets of 8.

OVERALL TECHNIQUE SCORE

81 / 100

Provisional Technique Score

Provisional: uses only the 4 of 5 measurements available in this clip (65% of the scoring weight). Missing measurements are left out, not counted as zero, so the score may change with a clearer clip.

Evidence: Medium

Video quality: Good

Clear footage — measurements are as reliable as a single camera allows.

Video quality describes the footage, not the player's technique.

Area	Score	Measured
Follow-through balance	98/100	1 of 1
Trunk alignment	82/100	1 of 1
Front knee & front arm angles	80/100	1 of 2
Release position	73/100	1 of 1

What's working

- The release hand is high above the head (1.92 torso lengths).
- The front arm is fairly extended at release (153.7°).
- The bowler follows through towards the batter and stays moving forward.

Measurements - front-on camera

Measurement	Value	Scale	What it means
Upper-body lean at release (6.33s)	32°		How far the upper body leans away from vertical at release.
Front arm bend at release (6.33s)	154°		How bent the non-bowling arm is at release.
Release hand height (6.33s)	1.92 × torso length		How high the bowling hand is above the head at release, in torso lengths.
Balance in follow-through (8.99s)	0.09 × torso length		Sideways gap between the hips and the feet after release; smaller means more balanced. Measured on an approximately timed frame, so treat it as a guide.

Values are measured from the video. Target ranges are not shown until coach-approved references are available.

Technique timeline - front-on camera

Run-up
Approximate timing - 0.0s (frame 0)

Earliest part of the approach in this clip.

Skeleton hidden: the joints weren't clear enough to draw accurately.

Not assessed reliably

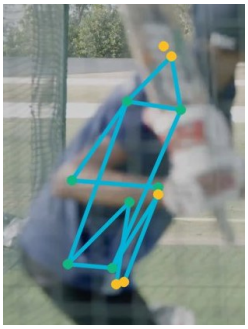

Gather
Not assessed reliably

This phase couldn't be identified reliably in the clip.

Not assessed reliably

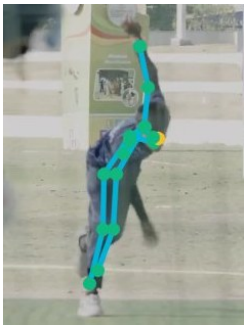

Back-foot contact
Not assessed reliably

This phase couldn't be identified reliably in the clip.

Front-foot contact
Approximate timing - 6.26s (frame 626)

Front foot landing, judged from the front ankle's lowest point.

Release & follow-through
Clear frame - 6.33s (frame 633)

Bowling hand at its highest point. Ball release itself isn't detected.

Upper-body lean at release: 32°

Front arm bend at release: 154°

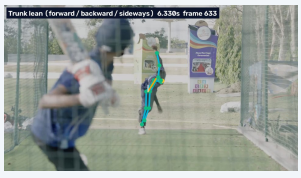

Release hand height: 1.92 × torso length

Balance in follow-through: 0.09 × torso length

Frames are cropped around the player from the original video at the times shown. 'Approximate timing' frames are best estimates, not exact events.

Ball: The ball couldn't be tracked reliably in this clip, so no ball path is shown.

Bowling biomechanics - front-on camera

Assessment	Result	Details	Reference frame
Back-foot landing Not available	The back-foot landing wasn't identified in this clip.		—
Type of bowling action Inconclusive	Back-foot contact wasn't identified, so the action can't be classified.		—
Shin lead at front-foot contact Not available	Shin angle needs a side-on camera.		—
Trunk lean (forward / backward / sideways) Measured	Whole-trunk lean measured at 2 of 3 key moments.	Back-foot contact: Not available (moment not identified) Front-foot contact: 22° sideways towards the bowling-arm side · 6.260 s (frame 626) Release: 32° sideways towards the bowling-arm side · 6.330 s (frame 633) Lower-back bending: Not measured — ordinary video has no spine points, so only whole-trunk lean is shown.	

Measured from the original video frames at their original timestamps (2D body tracking). These assessments are not part of the technique score. Trunk lean is whole-trunk lean; lower-back bending and spinal curvature are not measured.

Coaching feedback

Priority to improve

Keep the trunk steadier through release so the sideways lean does not keep increasing.

Why it matters

The trunk lean rose from 22° at front-foot contact to 32° at release. A steadier trunk can make the delivery easier to repeat and keep the release point consistent.

How to practise it

Practise the front-arm pull-down and tall-finish balance holds at easy pace, then film again from the side to check the lean.

Based on measurements: Upper-body lean at release: 32°; Front arm bend at release: 154°; Release hand height: 1.92 × torso length. Coaching text is an AI interpretation of the video and these measurements.

Personalised drills

Drill	Objective and instructions	Dose	Avoid
Front-arm pull-down	Create a steady, repeatable front-arm action that helps control trunk lean. Stand at the crease in the delivery position. Reach the front arm up and pull it down firmly towards the hip while keeping the head level and eyes on the target.	3 sets of 8	
Stump-target stride drill	Practise a repeatable front-foot landing and a straight line to the target. Place a marker at the landing spot. Do a short run-up, land the front foot on the marker pointing at the target, and finish with the chest tall.	4 sets of 6	
Tall-finish balance holds	Improve balance and control after release. Bowl at half pace and hold the follow-through position for two seconds with the hips over the front foot before moving on.	3 sets of 6	
Side-on and back-foot filming drill	Capture the back-foot landing and shin angle that this video could not show. Have a partner film from the side and from behind the arm at the same distance with no net in the way. Bowl six normal deliveries.	1 session, 6 deliveries per angle	

Practice plan

Day	Focus	Minutes
Day 1	Front-arm pull-down and posture	20
Day 2	Stump-target stride drill	25
Day 3	Rest or light mobility	10
Day 4	Tall-finish balance holds at half pace	20
Day 5	Full run-up bowling at a target	30
Day 6	Film a side-on and behind-the-arm clip	20
Day 7	Rest	0

Progress comparison

Measurement	Previous (26 Oct 2026, 10:57 PM IST)	Latest	Change
Upper-body lean at release	1°	32°	+31°
Front arm bend at release	110°	154°	+44°
Overall score	96 (Provisional)	81 (Provisional)	

Compared with your 26 Oct 2026 bowling clip from the same front-on camera angle. Only measurements taken in both clips are compared; differences in filming can also change the numbers. At least one of these scores is provisional, so compare them with care.

Your action plan

1. Practise “Front-arm pull-down” (3 sets of 8) to work on front arm.
2. Add “Stump-target stride drill” once the first drill feels comfortable.
3. Upload a new clip from the same camera angle in 1-2 weeks to track progress.

Filming tips for your next clip

• Add a side-on clip as well — front-knee angle can only be measured side-on.

About this report

Each measurement is compared with a coaching reference and the results are combined using fixed weights. Missing measurements are left out rather than counted as zero. The score describes technique in this clip only; it isn't an official rating.

Video quality is rated from the footage only: Poor if the player was found in under 60% of frames, the player was too small, or joints were mostly unclear; Fair if any other filming issue was found; otherwise Good. It is not part of the technique score.

Back-foot landing and back-foot orientation could not be identified. Measurements are 2D estimates from one camera; bat speed, ball speed and forces aren't measured.

AI-assisted coaching report. Not a medical assessment, does not guarantee injury prevention or performance, and is not an official selection credential.
