QA Player

Player	QA Player	**Report date**	27 Oct 2026, 11:07 PM IST
Analysis	Bowling	**Camera**	side-on
Video quality	Good	**Score status**	Provisional Technique Score

Three key takeaways

1. Balance in follow-through (0.13 × torso length) was your strongest measured area.
2. Front arm bend at release (165°) is the measurement with the most room to improve.
3. Practise “Stride and brace hold” — 4 sets of 5 balls.

OVERALL TECHNIQUE SCORE

86 / 100

Provisional Technique Score

Provisional: uses only the 5 of 5 measurements available in this clip (90% of the scoring weight). Missing measurements are left out, not counted as zero, so the score may change with a clearer clip.

Evidence: Medium

Video quality: Good

Clear footage — measurements are as reliable as a single camera allows.

Video quality describes the footage, not the player's technique.

Area	Score	Measured
Follow-through balance	100/100	1 of 1
Trunk alignment	74/100	1 of 1
Front knee & front arm angles	84/100	2 of 2
Release position	97/100	1 of 1

What's working

- High release hand position (0.74 torso lengths above the head).
- Front arm extended at release (164.7°), which suggests good use of the non-bowling arm.
- Hips and shoulders turn together, with only about 6° between them, and no shoulder turn-back before front-foot contact.
- Continuous, committed follow-through towards the batter.

Measurements - side-on camera

Measurement	Value	Scale	What it means
Front knee at release (3.7s)	155°		How straight the front leg is at release (180° is a straight leg).
Upper-body lean at release (3.7s)	41°		How far the upper body leans away from vertical at release.
Front arm bend at release (3.7s)	165°		How bent the non-bowling arm is at release.
Release hand height (3.7s)	0.74 × torso length		How high the bowling hand is above the head at release, in torso lengths.
Balance in follow-through (9.95s)	0.13 × torso length		Sideways gap between the hips and the feet after release; smaller means more balanced. Measured on an approximately timed frame, so treat it as a guide.

Values are measured from the video. Target ranges are not shown until coach-approved references are available.

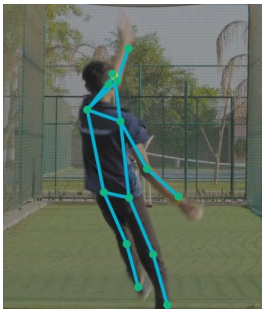

Technique timeline - side-on camera

Run-up

Approximate timing - 0.0s (frame 0)

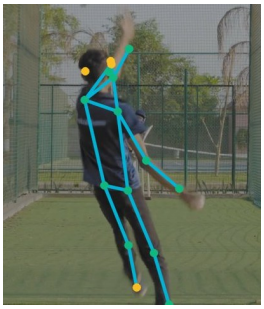

Earliest part of the approach in this clip.

Gather

Approximate timing - 3.0s (frame 180)

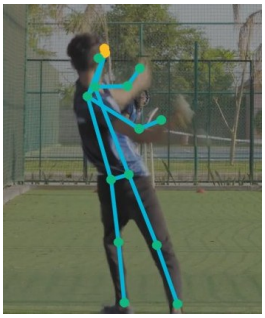

Hands closest to the chest before the jump.

Back-foot contact

Approximate timing - 3.017s (frame 181)

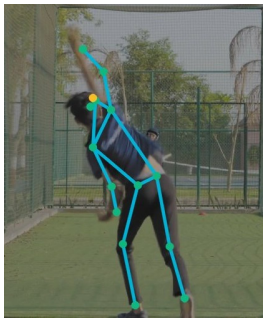

Back foot landing, judged from the back ankle's lowest point.

Front-foot contact

Approximate timing - 3.2s (frame 192)

Front foot landing, judged from the front ankle's lowest point.

Release & follow-through

Clear frame - 3.7s (frame 222)

Bowling hand at its highest point. Ball release itself isn't detected.

Front knee at release: 155°

Upper-body lean at release: 41°

Front arm bend at release: 165°

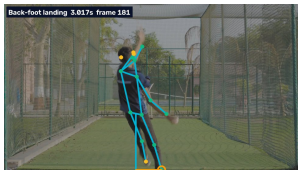

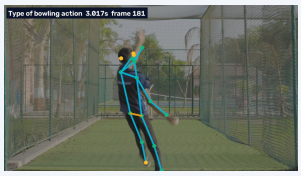

Release hand height: 0.74 × torso length

Balance in follow-through: 0.13 × torso length

Frames are cropped around the player from the original video at the times shown. 'Approximate timing' frames are best estimates, not exact events.

Ball: The ball couldn't be tracked reliably in this clip, so no ball path is shown.

Bowling biomechanics - side-on camera

Assessment	Result	Details	Reference frame
Back-foot landing Measured	Back foot landed at 3.02 s (frame 181).	Landing moment: 3.017 s (frame 181), to the nearest frame Foot placement: Not available from this camera angle or run-up direction. Foot direction: Not measurable by body tracking (no toe or heel points).	
Type of bowling a ction Measur ed	Semi-side-on action (approximate).	Shoulders at back-foot contact: about 47° from side-on Hips at back-foot contact: about 40° from side-on Hip-shoulder difference: about 6° Shoulder turn-back before front-foot contact: about 0°	
Shin lead at front-foot contact Measured	Front shin about 19° from vertical at front-foot contact, direction unclear (run-up direction not visible).	Shin angle from vertical: 19° Direction: direction unclear (run-up direction not visible) Measured at: front-foot contact, 3.200 s (frame 192)	
Trunk lean (forward / backward / sideways) M easured	Whole-trunk lean measured at 3 of 3 key moments.	Back-foot contact: 10° direction unclear · 3.017 s (frame 181) Front-foot contact: 19° direction unclear · 3.200 s (frame 192) Release: 41° direction unclear · 3.700 s (frame 222) Lower-back bending: Not measured — ordinary video has no spine points, so only whole-trunk lean is shown.	

Measured from the original video frames at their original timestamps (2D body tracking). These assessments are not part of the technique score. Trunk lean is whole-trunk lean; lower-back bending and spinal curvature are not measured.

Coaching feedback

Priority to improve

Check and steady your trunk lean and finish balance so the body does not fall away at release.

Why it matters

A large trunk lean (41.0° at release) combined with an unsteady finish can reduce control and make the action harder to repeat.

How to practise it

Bowl at reduced pace holding the finish for two seconds, then film side-on to see which way the trunk is leaning.

Based on measurements: Front knee at release: 155°; Upper-body lean at release: 41°; Front arm bend at release: 165°. Coaching text is an AI interpretation of the video and these measurements.

Personalised drills

Drill	Objective and instructions	Dose	Avoid
Stride and brace hold	Build a stable front-foot landing and a balanced finish. Bowl at 50% pace and hold the finish for two seconds. Check that the head stays over the front knee and you are not falling to one side.	4 sets of 5 balls	
Target-line follow-through	Keep the follow-through running straight towards the batter. Put cones along the line of the pitch. Finish the follow-through between them without drifting across.	3 sets of 6 balls	
Front arm pull-down drill	Keep the front arm strong and controlled to help trunk control. From a standing delivery position, reach the front arm up, then pull it firmly down to the hip as the bowling arm comes over.	3 sets of 8 reps	
Side-on camera check	Allow a clearer review of trunk lean and landing. Have a partner film a few deliveries from the side at hip height, with the whole body in view.	1 session of 12 balls	

Practice plan

Day	Focus	Minutes
Monday	Stride and brace hold at reduced pace	30
Tuesday	Front arm pull-down drill and target-line follow-through	30
Wednesday	Rest or light mobility work	15
Thursday	Bowling at 70% pace, focusing on balanced finish	35
Friday	Side-on filming session and review	30
Saturday	Match-pace bowling over, then review	40
Sunday	Rest	0

Your action plan

1. Practise “Stride and brace hold” (4 sets of 5 balls) to work on front foot contact.
2. Add “Target-line follow-through” once the first drill feels comfortable.
3. Upload a new clip from the same camera angle in 1-2 weeks to track progress.

Filming tips for your next clip

• Film side-on at hip height from 10-15 m, keeping the whole run-up, delivery stride and follow-through in frame.

About this report

Each measurement is compared with a coaching reference and the results are combined using fixed weights. Missing measurements are left out rather than counted as zero. The score describes technique in this clip only; it isn't an official rating.

Video quality is rated from the footage only: Poor if the player was found in under 60% of frames, the player was too small, or joints were mostly unclear; Fair if any other filming issue was found; otherwise Good. It is not part of the technique score.

Foot placement is not available from this camera angle. Measurements are 2D estimates from one camera; bat speed, ball speed and forces aren't measured.

AI-assisted coaching report. Not a medical assessment, does not guarantee injury prevention or performance, and is not an official selection credential.
