Analysis	Bowling	**Camera**	front-on
Video quality	Good	**Score status**	Provisional Technique Score

Three key takeaways

1. Release hand height (0.79 × torso length) was your strongest measured area.
2. Front arm bend at release (12°) is the measurement with the most room to improve.
3. Practise “Front arm pull-down drill” — 3 sets of 8.

OVERALL TECHNIQUE SCORE

57 / 100

Provisional Technique Score

Provisional: uses only the 4 of 5 measurements available in this clip (65% of the scoring weight). Missing measurements are left out, not counted as zero, so the score may change with a clearer clip.

Evidence: Medium

Video quality: Good

Clear footage — measurements are as reliable as a single camera allows.

Video quality describes the footage, not the player's technique.

Area	Score	Measured
Follow-through balance	82/100	1 of 1
Trunk alignment	52/100	1 of 1
Front knee & front arm angles	0/100	1 of 2
Release position	93/100	1 of 1

What's working

- High bowling hand above the head in the delivery, measured at 0.79 torso lengths.
- Moderate forward trunk lean at release (28.7°) shows the body is moving toward the target.
- Stable, balanced position after delivery (0.24 torso lengths, estimated).
- The run-up looks straight and controlled in the frames available.

Measurements - front-on camera

Measurement	Value	Scale	What it means
Upper-body lean at release (9.6s)	29°		How far the upper body leans away from vertical at release.
Front arm bend at release (9.6s)	12°		How bent the non-bowling arm is at release.
Release hand height (9.6s)	0.79 × torso length		How high the bowling hand is above the head at release, in torso lengths.
Balance in follow-through (10.27s)	0.24 × torso length		Sideways gap between the hips and the feet after release; smaller means more balanced. Measured on an approximately timed frame, so treat it as a guide.

Values are measured from the video. Target ranges are not shown until coach-approved references are available.

Technique timeline - front-on camera

Run-up
Approximate timing - 0.0s (frame 0)

Earliest part of the approach in this clip.

Not assessed reliably

Gather
Not assessed reliably

This phase couldn't be identified reliably in the clip.

Not assessed reliably

Back-foot contact
Not assessed reliably

This phase couldn't be identified reliably in the clip.

Front-foot contact
Approximate timing - 9.6s (frame 288)

Front foot landing, judged from the front ankle's lowest point.

Release & follow-through
Clear frame - 9.6s (frame 288)

Bowling hand at its highest point. Ball release itself isn't detected.

Upper-body lean at release: 29°

Front arm bend at release: 12°

Release hand height: 0.79 × torso length

Balance in follow-through: 0.24 × torso length

Frames are cropped around the player from the original video at the times shown. 'Approximate timing' frames are best estimates, not exact events.

Ball: The ball couldn't be tracked reliably in this clip, so no ball path is shown.

Coaching feedback

Priority to improve

Practise pulling the front arm in and down at release so the body can rotate through the delivery.

Why it matters

The front arm was nearly straight at release (12.1°), which may limit how well the body rotates and how repeatable the action is. A strong front arm pull can help the trunk and bowling arm work together.

How to practise it

Use the front arm pull-down drill, then the stride and freeze drill. Record from a clear front-on or side view to check the change.

Based on measurements: Upper-body lean at release: 29°; Front arm bend at release: 12°; Release hand height: 0.79 × torso length. Coaching text is an AI interpretation of the video and these measurements.

Personalised drills

Drill	Objective and instructions	Dose	Avoid
Front arm pull-down drill	Teach the front arm to pull in and down so the body rotates through the delivery. From a standing front-foot-landed position, reach the front arm up, then pull the elbow down to the hip while turning the chest to the target. Add a ball after a few reps.	3 sets of 8	Pulling the arm out to the side instead of down to the hip.
Stride and freeze drill	Build a firm, balanced front-foot landing and a steady head position. Take a short run, land in the delivery stride and hold the finish for two seconds. Check that the head is still and the hips are over the base.	4 sets of 6	Falling away to the side after landing.
Wall-line follow-through drill	Practise a full follow-through that goes forward rather than falling away. Bowl a few deliveries at a slow pace and finish with the bowling hand brushing past the opposite knee. Take two or three steps forward after release.	3 sets of 6 balls	Stopping the arm early or pulling away from the target.
Medicine-ball chest throw	Improve trunk and hip rotation toward the target. Stand side-on and throw a light ball from the chest to a partner, rotating the hips first and then the shoulders.	3 sets of 10	Using only the arms and not turning the hips.
Rhythm run-in drill	Create a repeatable run-up and delivery rhythm. Bowl at about 70% effort using the same number of strides, and mark the start and the landing spot. Aim to land on the same spot each time.	4 sets of 6 balls	Speeding up or shortening the last strides.

Practice plan

Day	Focus	Minutes
Monday	Front arm pull-down drill and stride and freeze drill	30
Tuesday	Rhythm run-in drill at 70% effort	30
Wednesday	Rest or light mobility work	15
Thursday	Medicine-ball chest throws and trunk rotation	25
Friday	Follow-through drill and bowling with focus on the front arm	35
Saturday	Net bowling session, film from side and front	45
Sunday	Rest	0

Your action plan

1. Practise “Front arm pull-down drill” (3 sets of 8) to work on front arm.
2. Add “Stride and freeze drill” once the first drill feels comfortable.
3. Upload a new clip from the same camera angle in 1-2 weeks to track progress.

Filming tips for your next clip

• Add a side-on clip as well — front-knee angle can only be measured side-on.

About this report

Each measurement is compared with a coaching reference and the results are combined using fixed weights. Missing measurements are left out rather than counted as zero. The score describes technique in this clip only; it isn't an official rating.

Video quality is rated from the footage only: Poor if the player was found in under 60% of frames, the player was too small, or joints were mostly unclear; Fair if any other filming issue was found; otherwise Good. It is not part of the technique score.

Back foot contact and gather phases were unavailable. Measurements are 2D estimates from one camera; bat speed, ball speed and forces aren't measured.

AI-assisted coaching report. Not a medical assessment, does not guarantee injury prevention or performance, and is not an official selection credential.
